Analysis of the genetic basis of GS has allowed 2 forms to be identified. One is a mild form associated with a homozygous 2 bp insertion in the TMAN sequence upstream of the UGTI*1 exon 1, and the other is a more severe form associated with heterozygosity for a mutation which, when homozygous, causes Crigar-Najjar type 2 disease. The first form is autosomal recessive and the second is inherited dominantly. Patients suffering from GS, which is benign, may have altered metabolism of some drugs, making it difficult to determine if an effect is due to the drug or the syndrome. Drug trial efficiency would be improved if potential participants can be screened for the genetic basis of GS, and eliminated or included on basis of them possessing.
                                                                                                                                                                                                                                                                                                                                                     misc_feature

This gene is known to be associated with Gilbert's syndrome (GS). GS is a mild, common form of unconjugated hyperbilirubinaemia associated with reduced bilirubin glucuronidation capacity. Analysis of the genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               may hinder result interpretation

                 cc capacity. Analysis of the genetic basis of GS has allowed 2 forms to be continued. One is a mild form associated with a homozygous 2 bp insertion in the TATA sequence upstream of the UGT1*1 exon 1, and cc insertion which, when homozygous, causes Crigler Najjar type 2 disease. The first form is autosomal recessive and the second is inherited committy. Patients suffering from GS, which is benign, may have altered metabolism of some drugs, making it difficult to determine if an effect is due to the drug or the syndrome. Drug trial efficiency would be improved if potential participants can be screened for the genetic basis of GS, and eliminated or included on basis of them possessing or not possessing GS. In this case, screening involves PCR amplification of the UGT gene, using the primers described in AAT79541-44.
                                                                                                                                                                                                   This sequence represents the upstream sequence, positions -611 to 9 in the patent, of uridine diphosphate glucuronosyltransferase (UGT) gene 1*1 exon 1. This gene is known to be associated with filbert's syndrome (GS). GS is a mild, common form of unconjugated syndrome (GS). GS is a mild, common form of unconjugated by the syndrome (GS).
                                                                                                                                                                                                                                                                                                              Improving drug trial efficiency comprises identifying participants with Gilbert's syndrome - useful as their altered drug metabolism may hinder result interpretation
                                                                                                                                                                                                                                                                                                                                                                                                                                                        16-MAR-1996;

Six unique N-termini of 286-289 amino acids are encoded by
six different first exons and identical C-termini of 246 amino
acids are encoded by the common exons 3-5. The UGT1 gene locus
encodes a family of UDP-glucuronosyl transferase isorymes, two of
which metabolise bilirubin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAQ33024 standard; DNA; 1167 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               exon
                                                                                                                                                                                                                                The isolated gene locus, UGT1, has a sequence of about 10000 bp which represent (1) Exon 1, comprising 6 transcriptional units (UGT1F, E. D. C. BP and A), represented in AAQ27368 and

                                 alcohols, amines and fatty acids. Many of the reactions catalysed by UGTs result in toxic substances being converted to compounds which are core water soluble and are excreted. The invention relates to and identifies UGTl polymorphisms (AAZ45004-Z45041). The polymorphisms categories are useful as probes for detecting UGTl locus polymorphisms indicative of altered UGTl expression or activity. These polymorphisms are associated with Crigier-Najjar and Gilbert syndromes (unconjugated to hyperbilirubinamenia) and drug metabolism. The genotyping of the UGTl gene is used to predict the rate of metabolism of UGTl substrates, possible drug-drug interactions and adverse side effects (i.e. to optimize drug-drug interactions and adverse side effects (i.e. to optimize drug study the effects of polymorphisms on enzymatic activity. The UGTl sequences, including polymorphisms, can also be used to produce the corresponding proteins(or; its fragments) corto-generate transgenic corresponding proteins(or; its fragments) corto-generate transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Patients having Crigler-Najjar Syndrome (CN) Type I, have mutation present in the second common exon.
                                                                                                                                                                                                                                                                                                                                                              diphosphate-glucuronosyltransferase 1 (UGT1) exon sequences. The UGTs are a family of enzymes that catalyse the glucuronic acid conjugation of a wide range of endogenous and exogenous substrates including phenois.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 glucuronic acid, Crigler-Najjar syndrome; Gilbert syndrome; jaundice; unconjugated hyperbilirubinaemia; drug metabolism; transgenic animal; pharmacogenetic screening; diagnose; PCR primer; ss.

New nucleic acid representing polymorphisms in the human uridine diphosphate glucuronosyltransferase gene, used for diagnosis and evaluation of drug metabolism

Examples; Page 19; 63pp; English.

The polymorphism sequences are useful as probes for detecting UGT1 locus polymorphisms, indicative of altered UGT1 expression or activity. These polymorphisms, indicative of altered UGT1 expression or activity. These polymorphisms are associated with Crigler Najjar and Gilbert syndromes (unconjugated hyperbilirubinaemia) and drug metabolism. The genotyping of the UGT1 gene is used to predict the rate of metabolism. The genotyping substrates, possible drug-drug interactions and adverse side effects (i.e. to optimize drug dosage), and to screen for diseases caused by enzymatic activity. The UGT1 sequences, including polymorphisms on the used to produce the corresponding protein (or its fragments) or to generate transgenic animals or modified cells e.g. for pharmacogenetic Primers AAZ45074-Z45109 are used to sequence the human uridine diphosphate-glucuronosyltransferase 1 (UGT1) exon polymorphism sequences. The UGTs are a family of enzymes that catalyse the glucuronic acid conjugation of a wide range of endogenous and exogenous substrates including phenols, alcohols, amines and fatty acids. Many of the reactions catalysed by UGTs result in toxic substances being converted to compounds which are more water soluble and are excreted. The invention relates to and identifies UGT1 polymorphisms (AAZ45004-Z45041).

                                                                                                                                                                   5
                                                                                                                                                                                                                                                                                           The present invention describes a library of human polynucleotides comprising the sequences given in AAX12522 to AAX17779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one cdifferentially expressed gene product in a test sample from a cell cuspected of being cancerous, where the gene product is encoded by one cof the 5248 polynucleotide sequences given in AAX12532 to AAX1779. The copynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, comping, tissue typing or profiling, forensics, genetic analysis and considered considered to the specific polynucleotides for experimental, diagnostic and comping, tissue typing or profiling, forensics, genetic analysis and considered protein; and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to concerls; the polynucleotides may also be used to construct concers; the polynucleotides of the invention are especially used in the collapsois, prognosis and management of colorectal cancer, breast cancer, or and lung cancer. The polynucleotides can also be used to screen for copytide analogues and antagonists.
                                                                                                                                                                                                       Query Match

                                  The present sequence encodes a human bone morphogenetic protein-16 (C (BMP-16). Human BMP-16 is a homologue of a murine protein celled nodal, which is expressed in the mouse node during gastrulation. BMP-16 cDNA is consisted from a human genomic library screened with a probe derived from the nodal DNA sequence. The BMP-16 proteins can induce the formation of bone, cartilage or other connective tissue. They can be used for treating companies the proteins of the proteins and wounds. They can also increase or healing of various types of tissues and wounds. They can also increase companies, astrocytic and glial cell survival and therefore be useful in transplantation and treatment of conditions exhibiting a decrease in euronal survival and repair. They can also exhibiting a decrease in cellogienic, chemotactic and/or chemostractant properties, and effects on cells including induction of collagen synthesis, fibrosis, cold ifferentiation responses, cell proliferative responses and responses con properties make the proteins potential agents for wound healing, creduction of fibrosis and reduction of scar tissue formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated bone morphogenetic protein-16 - used to develop products for inducing formation of bone, cartilage and other connective tissue, particularly for wound healing and tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mat_peptide

                                                                                                                                                                                                                                                    Sequence 1095 BP; 231 A; 296 C; 312 G; 256 T; 0 other;
                                                                                                                                                                                                                                                                                                therapeutically. Antibodies or other specific binding agents, are used to detect recombinant proteins and fragments of the Tango nucleotide sequence can be used as probes or primers for detecting the Tango gene, specifically mRNA, in usual hybridisation or amplification assays. These assays are used for diagnosis of diseases associated with abnormal expression of Tango proteins, e.g. detecting mutations in the Tango gene. Fragments of the Tango nucleic acid sequence are also used for genetic mapping and chromosome identification, and as antisense, ribozyme or triplex forming therapeutics. Antibodies may also be used to generate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the nucleotide sequence encoding the human Tango-78 protein used in the method of the invention. Host cells containing the Tango protein are used to produce recombinant proteins for raising antibodies. It is also used in identifying specific binding agents (including cognate receptors), which can be used to
                                                                                                                                                                                                                                                                                      anti-idiotype antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; Fig 1; 67pp; English.

CC capacities including sexual development, pitultary hormore production, cc and the creation of bone and cartilage. The Nodal and Lefty polypeptides CC are useful for enhancing or enriching the growth and/or differentiation cC of specific cell populations, eg. embryonic cells or stem cells. They can be used to treat such conditions as osteoarthritis, osteoporosis, and cother connective tissues and/or organs such as liver, lung, cardiac, cother connective tissues and/or organs such as liver, lung, cardiac, compositions containing nodal and lefty proteins can be useful for growth formation, for treating periodontal disease and cc may be used for the treatment of tumours, cancers, interstitial lung cardiac, also be used for the treatment of tumours, cancers, interstitial lung cof cell function including augoimmunity, arthritis, leukaemia, lymphomas, can create a DNA encoding a human nodal polypeptide. The cDNA encoding the nodal protein is denomined under the arch checket.
                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel human nodal and lefty proteins which are members of the TGF-beta family. The human nodal and lefty proteins may be involved in a developmental process such as the correct formation of various structures or in one or more post-developmental

These can be used in the diagnosis and reatment of the ansport metabolic, neurological, reproductive, Gardivescular --- disorders, and real proliferations.

AAC98773 to AAC9923] encode the human pancreatic cancer associated corproteins, called pancreatic cancer antigens, given in AAB54008 to AAB54466. The human pancreatic cancer antigens have cytostatic, neuroprotective, nootropic, immunomobilatory retaxant, contraceptive. CC gynaecological, cardiant and antiinflammatory activities, and can be used to preventing, treating, or ameliorating an emetical condition or in assays copy of the polynucleotide and proteins can be used for guidencest and partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to genet, treat or prevent pancreatic disorders, especially cancer.

Agonists and antagonists to the antigens can be used to compare the cancer antigen polynucleotide. Can be used to design nucleic and diamossic methods. The proteins can be used to design nucleic and diamossic methods. The proteins can be used to generate antibodies which are used to putify, detect and target the polypeptides, including the proteins can be used to proteins can be used to tree; or proteins can be used to tree; or proteins can be used to tree; not can be used to generate antibodies which are used to putify, detect and target the polypeptides, including the proteins can be used to tree; not can be used to generate antibodies which are used to putify, detect and therapeutic methods. The proteins can be used to tree; not can be used to proteins can be used to protei

                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                          defects, periodontal disease or healing of various types of tissues and wounds. They can also increase neuronal, astrocytic and gilal cell survival and therefore be useful in transplantation and treatment of conditions exhibiting a decrease in neuronal survival and repair. They can also exhibit properties such as angiogenic, chemotactic and/or chemoattractant properties, and effects on cells including induction of collagen synthesis, fibrosis, differentiation responses, cell proliferative responses and responses involving cell adhesion, migration and extracellular matrices: These properties make the proteins potential agents for wound healing, reduction of fibrosis and reduction of scar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               exon of the genomic DNA for human bone morphogenetic protein-16 (BMP-16). Human BMP-16 is a homologue of a murine protein celled nodal, which is expressed in the mouse node during gastrulation. The BMP-16 proteins can induce the formation of bone, cartilage or other connective tissue. They

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A cDNA clone (AAT10554) coding for mammary gland factor (MGF) (AAR88199) was obtd. from a cDNA library derived from sheep lactating mammary tissue mRNA using probes (AAT10555-56) based on internal peptides of MGF. The cDNA is used to produce recombinant MGF in host cells, or as a probe. Transgenic animals, e.g. sheep, overexpressing MGF can be produced in order to increase milk producer to produce a therapeutically useful protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;
